Humi care beads instructions

Quick tip: Using humidity beads is the best way to keep your desktop humidor at the right RH level. One advantage of beads is that it will generate a two-way humidification system, i.e. humidity (if the humidifier is too dry) and will absorb humidity (if the humidifier is too humid). Dry humidors can ruin cigars by brittleness, cracks and crumbling. But worse than that, cigars can taste harsh if they are too dry. However, humidors can also become too moist, in this case the cigars cannot burn properly, draw tougher, or worse... They can become fungi. Therefore, it is absolutely necessary to put the humidor in the perfect RH. The perfect range of RH is 64-69% RH (relative humidity). Read more: Cigar Tip: Setting a Coolidor A Bead Pouch should be about the size of a large lime or lemon. The standard green foam humidification device that comes with the humidifier must be crushed and thrown into the trash. Do not use black paste with a green foam humidification device because it is almost certain that you are likely to spoil the cigar causing headaches. In addition, we do not recommend gel jars and other similar humidification options. This type of humidification device is a one-way device in that it knows how to generate and not absorb humidity. The Boveda pack is a good bi-directional option, but I recommend these for small, 20-count or travel humidors because they dry quickly, so it's going to be expensive to use on desktop humidors over long distances. Yes, you can charge the Boveda pack, but it's much more effort than you need. The beads are the way to go! The beads last forever and all they need is a few sprays of distilled water every week or two. There are two types of beads you can buy and they are all very similar. Heartfelt beads (probably the best option but the most expensive) crystal type kitty rubbish (the cheapest solution but it is important to buy the right kind) the correct type of kitty litter is crystal pearls that do not contain blue fragrant lumps. Some people have argued that kitty trash is not as good as heartfelt balls. They may be right, but in one test I performed kitty crap as good as the Heartfelt ball. To set the humidity bead pouch (keep in mind I'm not a scientist), use the following steps by step guide: the setting is as easy as this: pour 1/4 cup of beads (or garbage) into the toes of the new panty hose. Tie the cut-off excess with a panty hose. Spray with 3-4 squirts of distilled water. Place the cigar on a humidor that does not touch it. Unwind and smoke the cigar knowing that your worries are over. Depending on rh readings from the digital hygrometer, all you need to do is spray distilled water every week or every two weeks. Don't rely on the analog hygrometer that comes with the humidity because the hygrometer is very inaccurate - our recommended hygrometer is the XIKAR round digital hygrometer. Depending on the humidor setting, you may need to add more bead pouches. A good rule of thumb is one 3 oz pouch per 50 cigars. Here in the arid climate of Colorado, I doubled my recipe. Note that the bead pouch should be about the size of the lime. Note: The rule of thumb how many beads to use is to use for every 500 cubic inches of humidity beads and every 500 cubic inches for every 500 cubic inches. This information can be found by multiplying the humidor's length x width x height. Example: Humidor measures 10 x 24 x 36 = 8,640 cubic inches. Divide cubic inches into 500 and need about 17 ounces of beads. We will make this easier. Here's a basic guide to the amount of beads to use for various humidor sizes: Remember, one bead pouch is about 3 ounces (about the size of lime) humidor 1 – 20 counts travel humidor small, Half size bead pouch 20 – 100 count humidor 1 bead pouch 100 – 300 count humidor 2 bead pouch or 1 half pouch 500 count humidor 3 – 4 bead pouch 1,000 count humidor 3 – 4 double-filled bead pouches or three cigar boxes are filled with 10 oz beaded coolidor 25 quart 1 pouch 70 quart 2.5 quart 250 quaries 2 cigar boxes, cigar wine in various sizes, in various sizes. Cigar wine inadosine comes in a variety of sizes. As long as you measure, you need to calculate the internal size yourself. Important: Do not soak the beads through spray or with too much water. Only a few squirts are all you need (too much water can cause the beads to crack and become less effective, or worse yet, too much water can lead to mildew). And that's all! The beads are never bad or need replacement. What they need is a few squirts of distilled water every few weeks. And the fun part is that after a few months with cigars, the bead pouch smells like a delicious cigarette! If you have cigar smoking tips you want to share, send 2 or 4 sentences long tips, with a nice picture explaining your tip: sensei@cigardojo.com we will credit all the tips to the person who submitted it, so be sure to include a real name or nickname along with your tip. Allow a few weeks to post your tips when you feel it will be good timing. Also, if you don't feel it's already too similar or fit, you may not post a tip.
